Bitcoin is The Ultimate Replacement For The World's Current Monetary System.

Brian Ruslan

May, 2025

Abstract, It's clear that we've entered Q2 of 2025. Bitcoin has become the seventh largest asset in the world. It's evident that this cryptocurrency is developing and innovating rapidly. It's clear that Bitcoin will soon overtake gold to become the second-largest asset class, leaving other major American stocks like Microsoft, Google, and Amazon in the dust. If people don't buy now, they'll never be able to buy again because the price is too high. Don't make the mistake of thinking that the price will hit \$90K and then drop again. The price and price action of Bitcoin itself are not according to your wishes. You will not be able to get the Bitcoin price you want. It's impossible to know the exact bottom of Bitcoin. The right time to buy Bitcoin is when the price is high. When the price is high, many people try to buy at a low price, thinking they're smart. This is human egoism. It's not just in the cryptocurrency market; it's also in the stock market and other financial markets.

Those who believe they are always waiting for the price of Bitcoin to fall have below-average intellectual standards. If humans still do not believe in the credibility of their assets, it's clear that the person has not studied this technology well or its potential in the future.

It's Clear That the Financial System is Riddled With Lies.

The comparison arises when you save one hundred million in a deposit or mutual fund and if you combine it into Bitcoin then you will see a very different percentage increase in a period of two years, you will feel fooled by the existing financial system if you save money in a deposit or mutual fund, because with Bitcoin it is an asset that we can control ourselves and is transparent to anyone who owns it, Bitcoin is an asset that we can control ourselves for ourselves without any interference from other people involved in our assets.

This era has changed. Digital gold like this is finally coming to life, and people are realizing that the **inflation they created is a lie**. The percentage given by the government is nothing more than a sedative for the lower middle class, who cannot think critically and find the truth behind the world economic system. Many people are already aware of the money-printing system that drains the value of money itself, and many of them are no longer saving deposits in banks.

We are living in an era where the end of the global monetary economic system is coming, where people all over the world have assets and money with a fair and just system. In the next few years there will be a death spiral of debt that will also change the global economic order system in the world.

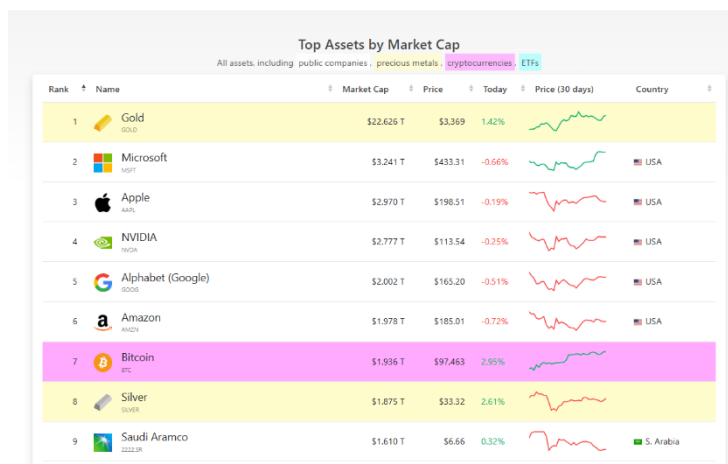

The change in the price of Bitcoin to ARS (Argentine Peso) or Turkish Lira is irrefutable proof that the price will continue to soar. People are already aware of the evils of printing money carelessly without a gold base behind the currency. Many people have protested in the streets because the government is printing too much money and is incapable of overcoming the economic crisis in their country. Printing money without a gold base is a mass public fraud. Emerging market countries like Argentina and Turkey have all protested. Southeast Asian countries, which are better off economically than those countries, should not be protesting. The real problem is not the minimum wage for employees and workers. **It is excessive money printing that needs to be stopped.**

We need to see the M2 Money Supply globally which is at 10-15% increase per year, because it feels useless if the minimum monthly wage increases but the money in circulation increases by 15% then the monthly salary has no value or returns to the initial basic value of money. If it happens continuously for three years then the money you have will be reduced in value by half, people will be poor forever and will continue to work if they only save Fiat money.

Comparison of Fiat Money and Bitcoin

I will give a simple example of the comparison between the value of Fiat money and Bitcoin, there will be two cars, the first car will drive a hundred kilometers then it will back up fifteen kilometers, then the second car every time it drives a hundred kilometers it will go forward again twenty kilometers. The example of the two cars above is a simple example of the comparison of the value of Fiat money and Bitcoin, the first car is the value of the Fiat currency while the second car is the value of Bitcoin.

Source: companiesmarketcap.com, May 5, 2025

It's clear to me that this is still very early because Bitcoin is still the number 7 asset in the world. Smart people understand that the most important asset is the value of scarce and desirable things. Buying a luxury watch for over a million dollars is a smart investment. It's better for your long-term financial health than saving a deposit. Buy a luxury watch and a painting with a constantly increasing value. Stocks and deposits are not a better investment than Fiat because they

can be printed again. **Buying shares only enriches the issuer and people who have held shares from the start.** All public shares in circulation can be made again because they have something called **Fiduciary Duty** as management when many people buy their shares to carry out Corporate Action.

Bitcoin is our best hope for taking full control of our money and wealth, and protecting them from government interference. Bitcoin is freedom for those who have it, or we will let those fools print money continuously. This is a historic moment: **the first exchange rate not born from war.**

Hegemony of Strong Fiat Currencies and Artificial Intelligence

The dollar's strength is indisputable. A strong military is the foundation of America's power, and it is indisputable that a strong military strengthens the dollar. The Chinese yuan is a strong currency. It has a strong value compared to other countries, such as Turkey and Argentina. America and China have strong military forces. Turkey and Argentina are not superpowers in military strength. The strength of their currency value will return to zero. The US dollar and the yuan are the world's most valuable fiat currencies today because they have strong military capabilities.

There will be two classes in this world: the super-rich and the very poor. AI will take over all jobs and productivity from humans. There will be no more farmers planting in the next ten years. Those who plow the fields are humanoid robots that are similar to human productivity. This is already sophisticated and its development is very fast.

Productivity increases. People don't have the money. They become poor and miserable. They get thrown out of their living environment. On Labor Day, people protest in several countries to increase the minimum monthly wage. The future of work is humanoid robots. They will take the place of workers because they can work by themselves.

This is not a message to scare; it is a reminder that adapting to technological developments is essential. The ability to learn and think critically is vital to surviving in a rapidly changing world. It's clear to me that this is just a bunch of facts, figures, and data.

Bitcoin is not just software; it's a ship for all of us. Those who want to join the Bitcoin ship will succeed, while those who don't will be left behind.

Hold your own Bitcoin as a form of freedom. Never entrust your money or Bitcoin to others. Take control of your own key and Bitcoin. Exercise self-custody. Don't trust Bitcoin to an exchange. Use it only as a transaction method and perform self-custody.

Conclusion

Bitcoin is emerging not just as a digital asset, but as the most viable and revolutionary alternative to the world's failing fiat-based monetary system. As of Q2 2025, Bitcoin has already risen to become the seventh-largest asset globally and is on a clear trajectory to surpass gold as the second-largest asset class. Its decentralized, transparent, and scarce nature positions it as a hedge against inflation, government overreach, and the systemic corruption embedded in traditional finance.

The current global financial system—driven by unchecked money printing, artificial interest rates, and centralized control—has eroded purchasing power, especially in emerging economies like Argentina and Turkey, where citizens are increasingly turning to Bitcoin as a store of value. This trend serves as irrefutable proof that fiat currencies not backed by tangible value are inherently unstable and unsustainable in the long term.

Bitcoin offers individuals full control over their wealth without reliance on banks or governments. It represents a paradigm shift toward financial sovereignty, self-custody, and freedom. The comparison between fiat money and Bitcoin is likened to regression versus progress: while fiat loses value over time due to inflation, Bitcoin continues to appreciate as adoption grows and scarcity remains fixed.

Moreover, with the rapid advancement of artificial intelligence and automation threatening to displace millions of jobs worldwide, Bitcoin stands out as a tool for economic empowerment in an era of increasing inequality. Those who fail to adapt risk being left behind in a future dominated by two classes—the super-rich and the very poor.

This is not merely speculation or hype; it is a historical transition. Bitcoin is more than software—it is a vessel for a new, fairer global financial order. The message is clear: those who embrace Bitcoin now will shape the future, while those who resist it will be swept aside by it. The time to act is now—take control of your wealth, secure your own keys, and prepare for the inevitable monetary revolution.
